- 1. Your infant may not need a dose of HepB at age 4 months depending on the type of vaccine that your healthcare provider uses.
- 2. Your infant may not need a dose of Hib vaccine or RV vaccine at age 6 months depending on the type of vaccine that your healthcare provider uses.
- 3. One dose is recommended for most people. Children younger than age 9 years who are receiving influenza vaccine for the first time, or who received only 1 dose in the previous season (if it was their first vaccination season), should receive 2 doses spaced at least 4 weeks apart this season
- 4. This dose of DTaP may be given as early as 12 months if it has been 6 months since the previous dose and you think you might not return for more shots by the time your child is age 18 months.

- 5. If your child's vaccinations are delayed or missed entirely, they should be given as soon as possible.
- 6. All girls and women age 11 through 26 years should be vaccinated with 3 doses of HPV vaccine, given over a 6-month period. (Girls as young as age 9 years may be vaccinated.)
- 7. If you have a teenager who is enrolling in college and planning to live in a dormitory and hasn't previously been vaccinated against meningococcal disease, they should be vaccinated now.

Please note: Some children may need additional vaccines. Talk to your healthcare provider.
